
Major RECORDING Problem ...

Posted by Sean - 2008/06/21 12:58

THE IMAGE BELOW SHOWS MY PROBLEM...

WHEN I GO TO RECORD IN PROTOOLS LE 7.1...

I AM NOT ABLE TO STOP IT ONCE STARTED. WHENEVER I HIT THE STOP RECORD BUTTON OR THE SPACE BAR, NOTHING HAPPENS.

DOES ANYONE KNOW HOW TO FIX THIS...?

PROTOOLS MBOX 7.1.1.

Running it on a MAC BOOK PRO 2.4.

Just upgraded the memory from 2gb to 4gb... I started noticing the problem around that time.

more details, like os version, are you using an external hard drive for recording, what cs, etc. We need it all...

There should be a sticky at the top of the specific forum for this post which lists the info you need to list.

Re:Major RECORDING Problem ...

Mac Tiger OS

Pro Tools LE 7.1.1

MBOX 2 Mini

Intel Core 2 Duo Processor

4gb total Memory

800MHZ Buss Speed

... And I'm not using an External Drive.

- How much memory (RAM) and what processor your machine has and how is your second media drive hooked to the machine.

It is a little difficult to troubleshoot through a forum. I would try some of the standard things first. Rather than go into detail about how to do them, I would suggest going to the digidesign site and downloading their "Tech Support Utility" it will do most of the standard repairs.

Also if the problem started occurring after you installed RAM, there is obviously a chance that there is something wrong there. Have you tried removing the RAM and seeing if the problem still remains?

have you tried trashing your preferences?? Thats a good starting point for issues such as this.

BTW, that Tech Support Utility will trash prefs etc.

Also, you may need to trash the databases for your drives, but I think the TSU does this too.

Thanks Fellas... I went back and trashed the preferences like you suggested.. and it worked!

I'm back to recording now.... I still get the H/W Buffer error but it's not that much of problem right now.

Much appreciated...

CS
