
MIDI inconsistance

Posted by pashosha - 2008/07/03 08:06

I've purchased ProTools LE with MBox2Pro last month. My computer hardware meets all the requirments as far as I can tell, and yet whenever I try to use a MIDI click or otherwise a MIDI instrument, the program seems to be going in an out of sync.

So far I managed to overcome the click issue by creating an audio click, but I want to use the BFD plugin supplied with the software, and it won't work properly.

The thing is, if I only open the plugin, it does work. It's only when I try to use in the general window, with or without activating other tracks, it starts to studder.

Help?

Hey - you should probably have put this post in the LE help Forum - this ones specifically for McDSP plugs, I'd move it for you but I don't have the power!

When you do, give us a bit more infortmation about your system and we should be able to help you out, theres a sticky at the top of the LE forum describing what we look for.

See you over there! :woohoo:
